Remote · UTC-2 — UTC+2

SUMMARY

Fullstack engineer who owns the whole product: interface, backend, payment layer and AI systems. Built a GameFi ecosystem for Telegram, Web and Android on a single financial layer, a multi-tenant SaaS platform with a six-agent AI pipeline, and a shared crypto-payment layer used by several products.

2020 career start · **[N]** products in production · **[N]** users · **6** AI agents in MetaForge

EXPERIENCE

Fullstack Developer — GC Group — 2025 — present

Crypto / Web3 and internal web products. [team: N people; what I personally own]

- **NFINE** — a GameFi ecosystem for Telegram, Web and Android: the token website and the app. The economy, social mechanics, farming, quests and prediction mechanics run through a single financial layer with a transaction ledger. [result: users, transaction volume]
- **MetaForge** — a multi-tenant SaaS platform for running a company: projects, tasks, employees, documents, finances. Permissions are enforced on the backend by role and area of responsibility — the same model limits what the built-in AI can see. [result]
- **MetaForge AI pipeline** — orchestration of several models through clarifier → architect → developer → reviewer → security → deployer stages, plus a Docker environment that runs generated code with a live preview.
- **Payment layer** shared by several products: payment sessions, transaction tracking and payouts to user wallets. [how many products, volume]
- **Realtime and background jobs**: WebSocket mechanics, blockchain checks, daily quests, reward payouts.

[role / projects] — 2023 — 2025

[what I did between the internship and GC Group]

Frontend Developer Intern — Smart Techno Lab — 2023 · 4 months

Commercial frontend development as part of a team. [stack and 1-2 concrete tasks]

Freelance Developer — 2020 — 2023

Websites and landing pages for private clients using HTML, CSS and JavaScript.

OTHER PROJECTS

- **BAC Token** — token website and Telegram Mini App for Business Angels Community: Telegram sign-up, balances, top-ups via a crypto payment gateway, an in-app store. Product design and fullstack (React, Python).
- **FreeSmrks** — launch website for a crypto token: design and React frontend.
- **Under NDA** (happy to walk through in person): a TON payment gateway; a crypto wallet operations system; a unified gateway to AI providers (Claude, OpenAI, DeepSeek, Grok); TON DevTools — analytics for tokens, pools, exchanges and transactions.

HOW I WORK WITH AI

Mindcoding, not vibe coding: AI writes a lot of the code, I make the decisions. Agents speed up the work, while architecture, the data model, payments, access control and security stay under my control. Tools: [list]. [example result: MVP in N weeks]

SKILLS

Frontend	TypeScript, React, MobX, Redux, Zustand, React Router, Tailwind CSS, SCSS Modules
Backend	Go (chi), Python, FastAPI, Pydantic, REST API, WebSocket, JWT
Money & Web3	TON SDK, payment gateways, transaction ledger, transaction indexing, wallet deep-linking, USDT
AI systems	LLM orchestration, multi-agent pipelines, Claude · OpenAI · DeepSeek · Grok, Docker sandboxes, n8n
Data	MongoDB, PostgreSQL, SQLite, MinIO, S3 / GCS
Platforms	Telegram Mini Apps, Web, Android WebView, Docker, Git (Gitea, GitLab)
Languages	Russian — native, English — C1
Education	[university, degree, year — or remove this row]
