SUMMARY

I take a task end to end and ship it to production: frontend, backend, integrations. Single-handedly built a GameFi ecosystem for Telegram, Web and Android, and took a multi-tenant SaaS platform from idea to MVP — it is now used by its first clients.

2020 career start **10+** products in production **5,000** sign-ups in NFINE **6** AI agents in MetaForge

EXPERIENCE

Fullstack Developer — instate (formerly GC Group) 2025 — present

Software development company: crypto / Web3 products and B2B SaaS.

- Designed **MetaForge** and built it to MVP on my own — a SaaS platform for running a company: projects, tasks, documents, finances. We now develop it as a team of 3, and it already has its first clients.
- Built an AI assistant into MetaForge that only sees the data the user has access to, and a 6-agent AI pipeline that takes a task from analysis to reviewed code running in an isolated environment.
- Single-handedly built **NFINE**, a GameFi app for Telegram, Web and Android: design, frontend, backend, microservices. **5,000 sign-ups, 500–1,000 active users.**
- Built a shared payment layer for 5 of the company's crypto products: accepting payments, tracking transactions and paying out to user wallets.
- Also under NDA: a TON payment gateway, a crypto wallet operations system, a gateway to AI providers (Claude, OpenAI, DeepSeek, Grok), TON DevTools analytics. Happy to go into detail in an interview.

Freelance Developer 2020 — 2025

Websites, landing pages and web apps for private clients.

- Built the token website and a Telegram Mini App for the **BAC** business-angel community: Telegram sign-in, balances, crypto top-ups, an in-app store (React, Python).
- Also: e-commerce for the fashion brand **VOLKOFF**, a token launch site for **FreeSmrks**, the **Proof of Capital** landing concept.

Frontend Developer Intern — Smart Techno Lab 2023 · 4 months

Commercial frontend development with React as part of a team.

HOW I WORK WITH AI

Mindcoding (my term), not vibe coding: AI writes a lot of the code, I make the decisions. Together with the agent I write the project rules, a project map and docs; tasks live in a prioritised pool, and the agent takes them one at a time or in batches of up to 10, checks its work against the architecture and sends the result to me for review. A task that would take a junior/middle developer a day takes minutes of agent time plus my review. Tools: Claude Code, Codex, Greta — my own agent for MetaForge.

SKILLS

Frontend	TypeScript, React, MobX, Redux, Zustand, React Router, Tailwind CSS, SCSS Modules
Backend	Go (chi), Python, FastAPI, Pydantic, REST API, WebSocket, JWT, microservices
Money & Web3	TON SDK, payment gateways, transaction ledger, transaction indexing, wallet deep-linking, USDT
AI systems	Claude Code, Codex, LLM orchestration, multi-agent pipelines, Claude · OpenAI · DeepSeek · Grok, Docker sandboxes, n8n
Data	MongoDB, PostgreSQL, SQLite, MinIO, S3 / GCS
Platforms	Telegram Mini Apps, Web, Android WebView, Docker, Git (Gitea, GitLab)
Languages	Russian — native, English — C1
Education	Higher education in linguistics and translation
